

IDE Guide

By Charlie Hill

Running the project

- Download the Milestone 2 folder from my GitHub
- Extract the files and make sure HillMain.java and Lexer.java are there
- Run HillMain.java in either the command line or your and IDE of your choice such as Eclipse

Working with my IDE

- When my IDE is launched a window will appear. It is made using JavaFX and an HTML editor panel.
- The large white space is where the user can enter their code
- Pressing the run lexer button will send the code through the lexer to make sure it is valid to the grammar.
- Comments are set at green, accepted code is set as blue and errors are set as red.
- Changing the color scheme to “Alternate Colors” will change the color of comments and accepted code.
